NATERA, INC.,
Defendant.

C.A. No. 19-cv-662-CFC-CJB

~~PROPOSED~~ JURY VERDICT FORM

INSTRUCTIONS

2

In answering the following questions and filling out this Verdict Form, you are to follow all of the instructions I have given you. Your answer to each question must be **unanimous**. Some of the questions contain legal terms that are explained in detail in the Jury Instructions. Please refer to the Jury Instructions if you are unsure about the meaning or usage of any legal term that appears in the questions below.

CAREDx QUESTIONS

CareDx Question No. 1

4

Alleged Advertising Claim A

More sensitive and specific than current assessment tools across all types of rejection.

Introducing Prospera

Prospera is powered by highly optimized, proprietary cell-free DNA (cfDNA) technology. As part of your tool kit, Prospera assesses all types of kidney transplant rejection² with the greatest precision.^{1,3}

- Simpler and less invasive than biopsy
- More sensitive and specific than current assessment tools across all types of rejection^{2,4,5}
- Up to 5x less variability than first-generation donor-derived cell-free DNA technology^{1,3}

JTX-7.2 (Brochure)

- **More sensitive and specific than current assessment tools across all types of rejection:**^{2,3,5} Serum creatinine tests are the current baseline screening standard, yet are not accurate enough for kidney transplant injury. Since then, first generation cell-free DNA technology has exhibited high variability. Prospera's published data shows better performance than both assessment methods.

Natera Announces Publication of Kidney Transplant Validation Study, Demonstrating Superior Data in Detection of Clinical and Subclinical Rejection

Represents Successful Achievement of All 2018 Commercialization Milestones, on Path to 2019 Launch

SAN CARLOS, Calif., Jan. 7, 2019 /PRNewswire/ -- [Natera, Inc.](#) (NASDAQ: NTRA), a leader in cell-free DNA, today announced clinical validation study results published in the *Journal of Clinical Medicine*,¹ demonstrating the highly accurate performance of its donor-derived cell-free DNA (dd-cfDNA) test for active allograft rejection in kidney transplant recipients, including higher sensitivity and nearly 18% higher area under the curve (AUC) than the competitive dd-cfDNA assay.^{1,2} The study also reports the first accurate detection of T-cell mediated rejection (TCMR) and subclinical rejection. This marks the successful completion of all 2018 commercialization milestones, and is in line with the company's plan to secure Medicare coverage and commercially launch its test in 2019.

QUESTION NO. 7:

Did CareDx prove by a preponderance of the evidence that Natera is liable for false advertising for **Alleged Advertising Claim G**?

YES (for CareDx) NO (for Natera)

CareDx Question No. 8

11

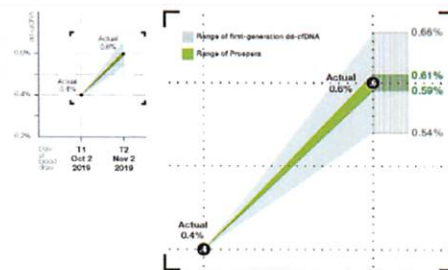

Alleged Advertising Claim H

Unparalleled precision.

1 Highly optimized to significantly reduce variability

Based on analytical validation data, Prospera exhibited up to 5x less variability in results.^{1,3}

Patient Test Summary Example*

T1 dd-cfDNA result: 0.4%
T2 dd-cfDNA result: 0.6%Depending on the dd-cfDNA lab chosen, the percent change in the dd-cfDNA level could have a range as large as 30%–60% (first generation dd-cfDNA testing), or as small as 47.5%–52.5% (Prospera)^{1,3}—whereas the true percent change is 50%.

*Expected ranges are a 1 standard deviation from actual dd-cfDNA level based on coefficient of variation.

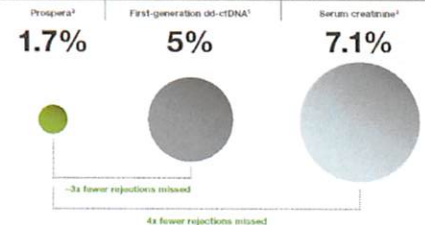

2 Now—catch ALL rejection types with a single blood draw

Prospera's unique ability to identify T cell-mediated rejection gives a more comprehensive view of your patient's rejection status.^{2,4}

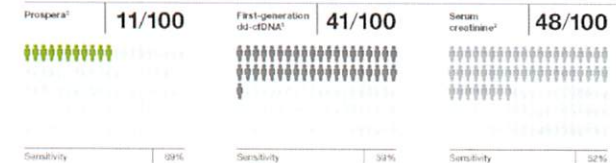

Rejection Types	Prospera ²	First-generation dd-cfDNA ⁴
Antibody-mediated rejection (ABMR)	✓ Yes	✓ Yes
T cell-mediated rejection (TCMR) ≥ 1A	✓ Yes	✗ No

Prospera is the first dd-cfDNA assay to publish performance in surveillance situations, providing results that can enable physicians to manage patients with previously unsuspected rejection.²

3 Lower risk of missing active rejection

With 98% negative predictive value (NPV), Prospera misses nearly three times fewer rejections⁵ than first-generation dd-cfDNA³ and four times fewer rejections⁶ than serum creatinine.⁷Percentage of patients with a negative result who have active rejection^{5,6,7}

4 Ultra-sensitive for more accurate classification

When comparing published clinical validation studies, Prospera demonstrated better performance in correctly classifying patients with active rejection—including cell-mediated rejection.^{1,2} Other tests may incorrectly classify patients experiencing active rejection as normal (up to 1 out of 2 cases).⁸Of 100 active rejection cases, the number of patients who would be missed, and told they are normal⁸⁸Using a 1% dd-cfDNA threshold

New Kidney360 Publication Highlights CareDx's AlloSure is Differentiated as the dd-cfDNA Test of Choice

Head to head data shows that not all dd-cfDNA is the same

SOUTH SAN FRANCISCO, Calif., June 22, 2020 (GLOBE NEWSWIRE) -- CareDx, Inc. (Nasdaq: CDNA), a leading precision medicine company focused on the discovery, development, and commercialization of clinically differentiated, high-value healthcare solutions for transplant patients and caregivers, announces today that the journal of the American Society of Nephrology, *Kidney360*, published a study evaluating AlloSure simultaneously with a different donor-derived cell-free DNA (dd-cfDNA) monitoring tool for allograft rejection.

This study evaluated 76 kidney transplant patients and surveilled post-transplant kidney rejection utilizing AlloSure and one other dd-cfDNA monitoring tool. Overall, the study found that while there were no significant differences between the diagnostic test characteristics, AlloSure was proven to be more accurate in clinical interpretation and significantly faster in delivering patient results. The study evaluated dd-cfDNA samples and concluded that AlloSure had a significantly superior turnaround time with 75% of the results returned at least one day earlier.

"Our study findings further validated the published data on AlloSure, a transplant-focused analytical tool for allograft rejection using donor-derived cell-free DNA," said Joseph K. Melancon, MD, The George Washington University Hospital. "Although dd-cfDNA tests are similar, they are not the same."

"While CareDx was not involved in this head-to-head comparison, we are not surprised by the results as AlloSure was developed for transplant specific needs, including accurate testing at low cfDNA levels and fast turnaround times," said Sham Dholakia, SVP of Medical Affairs at CareDx.
